CORRECTION

Asymptomatic hyperparathyroidism

(September 2003)

The article "How should I follow a patient with mildly elevated serum calcium and PTH, but no symptoms?" by Drs. Jennifer Wojtowicz and Christian Nasr (Cleve Clin J Med 2003; 70:811–813) contained an error. The article stated that the calcium-to-creatinine ratio is generally less than 0.01 in familial hypocalciuric hypercalcemia and greater than 0.02 in primary hyperparathyroidism. This should have been the ratio of calcium clearance to creatinine clearance (also known as fractional excretion of calcium). Thanks go to Dr. Juraj Osterman of the University of South Carolina Medical School, Columbia, SC, for pointing this out.
